Critical Design Review

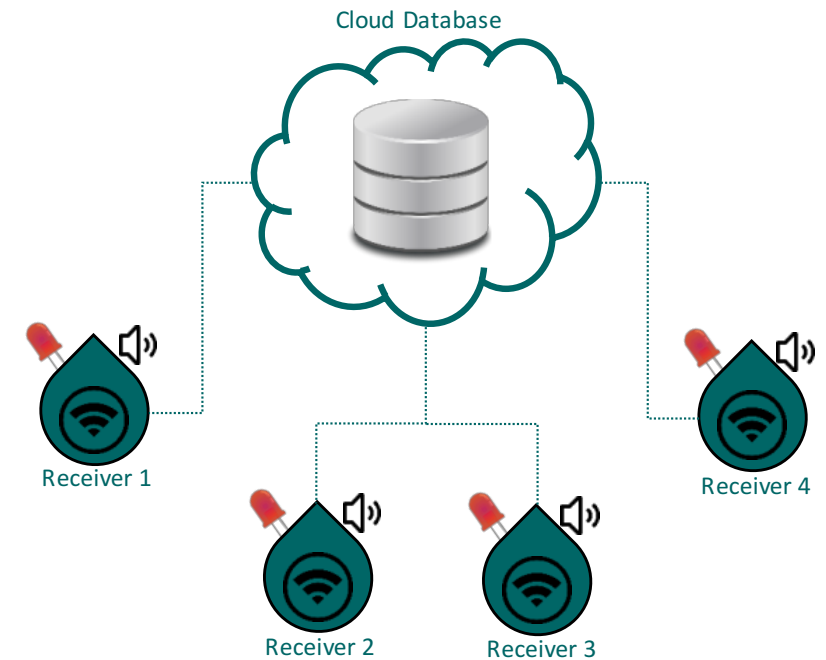

09-09-2016

Group B

Maria-Camila Nuñez (EE)

Ramon Jimenez (EE)

Mannuel Cortes (EE, CS)

About HINT

A system that makes notification tracking easy, fun, and interactive for the user.

RSSI

Control

Wearable Device

PCB w/ RF Transceiver

Laptop/Phone/Cloud

- Will only communicate with PCB in range
- Will only send RSSI data (received signal strength indication) and receive discrete signals for auxiliary I/O

- Will have a TCVR to communicate with both wearable and laptop/phone controller
- Will have main sensory I/O

- Will serve as the controller and database

About HINT

Questions?

Motivation

- Overall positive impact of the effects parenting has on children growing up
- Facilitate communication between parent and child while making it fun and interactive
- Research indicates that children who have some sort of schedule/chores have:
 - Higher self-esteem
 - Sense of responsibility
 - Qualities that contribute to higher success in school

- Scalability
- Internet of Things network
- Interactive notification tracking system
- Implementation of three out the five human senses

Questions?

Goals and Objectives

- Provide homeowners and families with best overall experience with HINT
 - User friendly and interactive by not being dependent on a phone to set a schedule/reminders
 - Affordability to other variations of products alike
- HINT will not only notify tasks around the home but will also enforce them
 - Notifications will not be ignored with the help of components in both the module and the wearable
- System is projected to stimulate the human senses to execute tasks obtained through tracking.
 - Sense of sight
 - Sense of touch
 - Sense of hearing

Specifications and Requirements

- Requirements were selected by sponsor and further refined by team
- Design critical requirements displayed in table as shown

Component	Parameter	Requirement
LCD Display	Visual Alerts & Cues	Display tasks to be completed
Module Circuit Board	Maximum Power Consumption	12 W
Response Button	User Interaction Interface	Large & interactive
Speaker	Auditory Alerts	Tone/voice
Ultrasonic Range Sensor	Minimum Detection Range	20 ft
Wearable Circuit Board	Maximum Power Consumption	.05 W
Wearable Circuit Board	Sensory Output Notifications	2 outputs
Wearable Device	Maximum Size	40 mm x 15 mm
Wearable Power Supply	Maximum Charge Time	3 hrs
Wearable Power Supply	Battery	Rechargeable
Wireless Communication Chip	Minimum Range	15 ft
Wireless Communication Chip	RSSI Sensitivity Accuracy	±5 dB

Questions?

How HINT Works

- HINT will use a combination of RSSI and range/motion detection to determine the proper time to output a notification
- RSSI – Received Signal Strength Indicator
 - Will be used with Ultrasonic Sensor to trigger notifications
 - Algorithm to be determined for approximate distance calculation by converting value to dBm and evaluating the power signal
- Range/motion detection
 - We will speak about this in the components (Ultrasonic Sensor) section

Questions?

Module

- Primary job is to utilize a sensory output notification system when user is detected
- It will work in conjunction with the wearable through Bluetooth Low Energy communication interface
- When user is detected by the motion sensor, and a predetermined RSSI value is met, there will be an output signal sent to the components on the module
- A signal will also be sent to the wearable to enable notification components to initiate their respective functions

Wireless MCU

- Microcontroller module with integrated trace antenna, oscillator, and RF front end
 - Removes the need for RF PCB design
- Uses a 32-bit, 48-MHz PSoC 4 BLE Microcontroller
 - 128 kB Flash
 - 16 kB SRAM
 - Integrated voltage regulation
 - 2.4 GHz RF Transceiver
 - ADC, DAC, and Serial peripherals
 - 36 Programmable GPIO pins
 - Ample development support
- All necessary pins route to headers J1 and J2
- Can be programmed/debugged with Cypress MiniProg3 USB kit
 - Mates with Molex connector 022-05-3051

Questions?

Ultrasonic Range Sensor

- Concept is to be utilized for range and distance calculation
- Follows requirement of a broad distance detection range
- Three interface output formats
- 2.5V to 5.5V supply with 2mA typical current draw
- Readings can occur up to every 50ms
- Analog voltage pin outputs voltage which corresponds to the distance

- Voltage Scaling

$$V_i = \frac{V_{cc}}{512}$$

V_{cc} = supplied voltage
 V_i = volts per inch

- Range

$$R_i = \frac{V_m}{V_i}$$

V_m = measured voltage
 R_i = range in inches

Questions?

Ultrasonic Range Sensor

- High sensitivity and wide beam sensor
- Each beam pattern is a 2D representation of the detection area of the sensor
- Beam patterns are read by looking at target size and distance detection

MB1000

LV-MaxSonar®-EZO™ Beam Pattern

Sample results for measured beam pattern are shown on a 30-cm grid. The detection pattern is shown for dowels of varying diameters that are placed in front of the sensor

A 6.1-mm (0.25-inch) diameter dowel
B 2.54-cm (1-inch) diameter dowel
C 8.89-cm (3.5-inch) diameter dowel

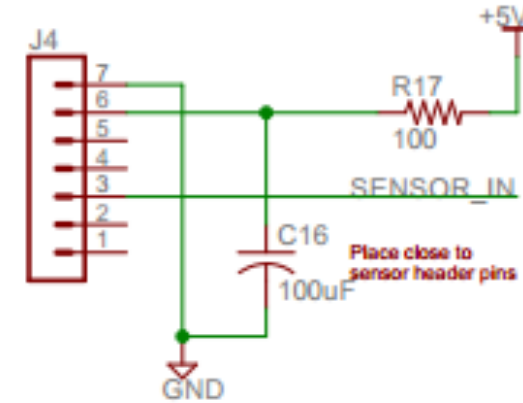

D 11-inch wide board moved left to right with the board parallel to the front sensor face. This shows the sensor's range capability.
Note: For people detection the pattern typically falls between charts A and B.

Beam Characteristics are Approximate

Beam Pattern drawn to a 1:95 scale for easy comparison to our other products.

MaxSonar Ultrasonic Sensor

- In case of electrical noise, a power filter was attached to the Vcc and GND pins in order to help mitigate the noise
- The capacitor value is of low ESR (Equivalent Series Resistance) which increases stability and load life

Questions?

LED Pushbutton

- Concept is to turn on with conjunction with notification on LCD display
- Follows visibility requirement, it is 4 inches in diameter
- Follows HINT's purpose
- Reliable for longevity use of 10 million cycles, and can be easily replaced
- 12V device, with internal 460Ω current limiting resistor
- 20 mA max current draw; 0.24W max power dissipation
- 5 terminal device with independent LED and switch circuit
- Can be easily “connectorized” and routed to a header

Questions?

Speaker

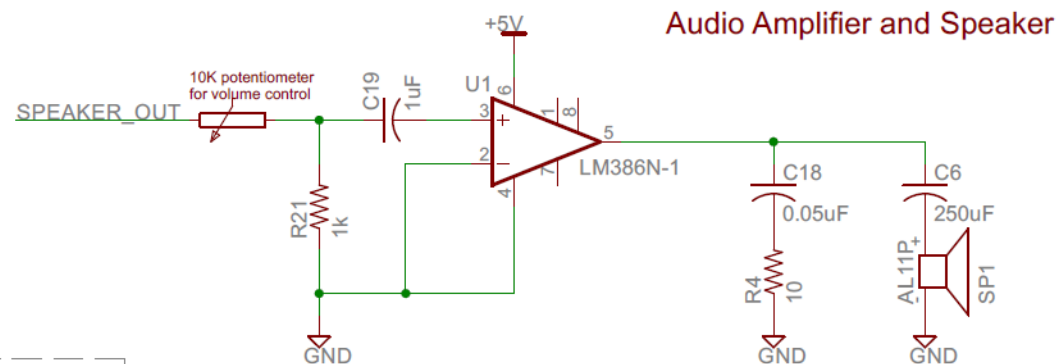

- Speaker enforces that notifications will not be ignored
- Synchronizes with the vibrating indicator on the wearable design as an auxiliary reminder
- 8Ω, 0.5W Speaker
- Interfaced through a T.I. LM386 low-voltage audio amplifier to improve audio quality
 - 5V part with max current draw of 8mA
 - Applies gain for stronger audio output
 - Comes in a DIP-8 package for easy prototyping

General Purpose Speaker

10mm x 6.35mm

With pins 1 and 8 open, gain = 20 dB

Questions?

Electronic Assembly DIP162

75mm x 27mm

- The LCD is only digital output to supplement the sensory I/O
- Will give the specific instructions on the scheduled task
- 2x16 characters suffices for short task descriptions
 - The simple display doesn't distract or take away from the sensory aspect of the project
- Blue screen with white LED backlight
- 5V part with 45 mA current draw (including backlighting)
- DIP module and 8 or 4-bit interface for easy prototyping

Prototype

- Prototype uses a Cypress CY8CKIT-042-BLE Pioneer Development Board
- Board contains a USB debugger and is programmed through the USB port
- Board receives 5VDC and can supply 3VDC from on-board regulator
- All GPIO and serial pins can be wired to breadboards out of the headers

Difficulties and Successes

Difficulties:

1. The project was first designed using a communication protocol called Zigbee. It was chosen due to its easiness in integrating multiple components in a low power mesh network but later realized the module we selected couldn't have firmware updates. Our sponsor also wanted future compatibility with phone applications, so Bluetooth Low Energy (BLE) was selected.
2. Communication topology had to change because BLE does not support mesh networks.
3. Our sponsor asked if we can put a speaker instead of a buzzer (original design) in case of future voice output.
4. Prototype components were running on different voltage supplies, causing communication issues.
5. The LED pushbutton (as easy as it sounds) had very poor documentation and resulted in being 5 terminals with unknown function to us.

Successes:

1. Successfully found BLE modules with easy integration and minimum-to-none external RF design.
 - Able to receive samples of development kits from Cypress Semiconductor Co.
2. Made module the central role for the prototype design, with capability of pairing to the wearable and a laptop. This design will be a standalone project without a network of "modules."
3. Successfully designed hardware for outputting audio with good quality and good gain and mass storage device.
4. Successfully designed level shifting circuitry during prototype.
5. Tested hardware for LED push-button and determined operating flexibility.

Battery Charge Management IC

- Purpose
 - Efficient charging of the battery
- Points
 - Charges battery at specified programmed current
 - Prevents damage being done to the cells during charge cycles
 - High input voltage range for low cost unregulated adapters
 - Adjustable termination and pre-charge current
 - Various protection features
- Specs
 - Charge current: 10mA to 250 mA
 - Input Voltage: 3.5V to 28 V
 - Output Voltage: 4.25 V to 4.37 V
 - Package Size: 1.60 mm x 0.90 mm

Bluetooth Module

- Purpose
 - Communicate RSSI value with module for proximity detection
- Points
 - Bluetooth 4.1 single-mode module
 - Very low current draw
 - Includes BLE stack
 - On-board ceramic antenna
 - Voltage is internally regulated over range
 - Smallest form factor found with antenna
- Specs
 - Input Voltage: 1.8 V to 5.5 V
 - Package Size: 10 mm x 10 mm
 - 32-bit processor
 - 128-KB flash memory
 - 16-KB SRAM memory
 - 16 GPIOs
 - SWD programming interface

Questions?

Difficulties and Successes

Difficulties:

1. Size
 - a. Design required to be small as to fit on wrist easily
 - b. This limited components that could be chosen for PCB
 - c. Due to small components PCB expense goes up to accommodate service
2. Power
 - a. Choosing a good battery management IC candidate
 - b. Selected a battery that fits within design constraints and supplies enough power
3. Sponsor
 - a. Working with customer on specification changes on the fly
4. Software
 - a. Programming BLE Module to interface with the Module

Successes:

1. Finding components that were small enough to accommodate design constraints
2. Finalizing component selection and creating schematic
3. Retrieving the evaluation boards (FREE) to be able to program ahead of PCB receive date
4. Sponsor providing the funds to purchase required components

Questions?

Development

- Development is being done with Cypress PSoC Creator 3.3
- Many example designs (especially RSSI related) ease the software development
- Cypress also supplies an iPhone application that measures RSSI readings from any BLE chip
 - This helps prototype module to wearable communication
- All GPIO and serial interface control is being added to the BLE software projects

Budget

Subsystems	Parts and Materials	Projected Qty	Price/Unit	Projected Cost	Current Cost
Module	Module Microcontroller	3	\$24	\$72	Free (Sample)
	BLE Development Kit	1	\$49	\$49	Free (Sample)
	Module LCD Display	1	\$27	\$27	\$27
	Response Button	2	\$10	\$20	\$20
	Range Sensor	1	\$27	\$27	\$27
	Buzzer/Speaker	1	\$8	\$8	Free (Sample)
	Printed Circuit Board	2	\$150	\$300	-
	Other PCB Expenditures	N/A	\$75	\$75	-
	AC Adapter	1	\$25	\$25	Free (Owned)
	Circuit Components	N/A	\$40	\$40	-
Enclosure	N/A	\$50	\$50	-	
Wearable	Wearable Microcontroller	3	\$12	\$36	-
	BLE Development Kit	1	\$20	\$20	Free (Sample)
	Vibration	3	\$2	\$6	-
	Printed Circuit Board	2	\$150	\$300	-
	Other PCB Expenditures	N/A	\$75	\$75	-
	Battery	2	\$15	\$30	-
	Power Management IC	2	\$2	\$4	-
	Circuit Components	N/A	\$40	\$40	-
	Enclosure	N/A	\$30	\$30	-
Both	Programmer/Debugger	1	\$89	\$89	-
Totals		Total Cost:		\$1,234	\$74
		Sponsorship:		\$1,000

Questions?

Path Forward

- Finalize hardware design (schematic)
- Finalize software design
- Finish integrating hardware and software in the prototype
- PCB design
- Testing and final integration
