

The slide features a light blue border and two vertical gold lines on the left and right sides. The title "EzRack" is in a large, bold, black font, with "Smart Bike Rack System" below it in a slightly smaller, regular black font.

EzRack

Smart Bike Rack System

Joel Gonzalez CpE

Vanessa Garcia De Quevedo CpE

Amanda Chanthalangsy EE

Trung Luu CpE

Motivation

We aim to encourage people to give up their cars in favor of bicycles for those shorter commutes. Heavily populated areas suffer from congestion, heavy traffic, and pollution which can be alleviated by encouraging commuters to take advantage of a greener solution such as using a bike for reaching nearby locations. Our smart bike rack aims to make bringing your bike anywhere as convenient as possible.

Goals and Objectives

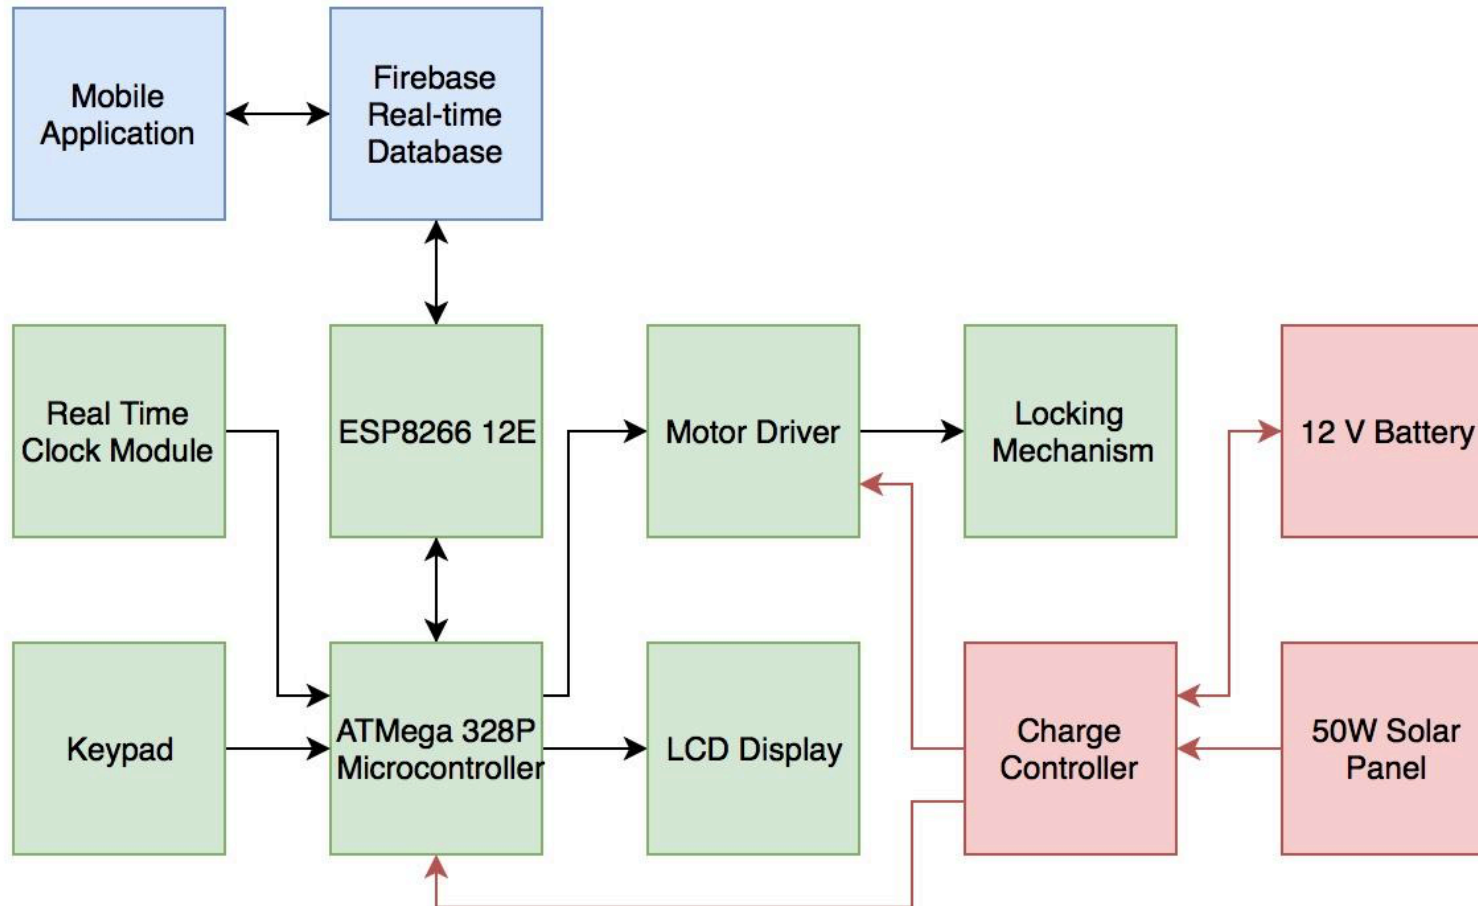

- Provide a convenient place to store your bike
- Eliminate the worry of having to carry a lock and chain
- Provide a means of reserving a slot and checking availability
- Self-sufficient with power provided by a solar panel

Specification

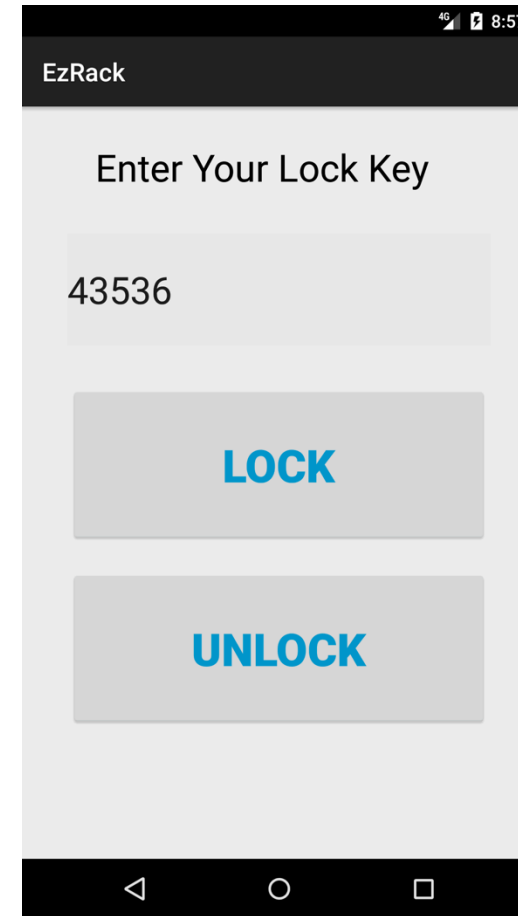

- Must be able to securely lock at least 2 bikes
- Must be able to hold bike wheels with a range of 26" - 28"
- Must free reserved slots after the allotted reservation time has passed
- Must be able to lock/unlock within 2 seconds of user input from the UI
- Power system must supply 12V
- Must be able to operate for 6 hrs without a recharge

System Design Block Diagram

Mobile Application

- Android application allows users to reserve, lock, and unlock, their slot directly from their android device.
- Reservations will be held for a maximum of 15 minutes.
- Users may choose to sign in or use the app as a guest. Signing in provides added security.

Firestore

Real-time Database: Secure and server less database is used to store the keys and update the slot availabilities in real time.

Authentication: Allows users to sign in using a variety of different accounts and providers including Google, Facebook, email, and phone.

Wi-Fi Connectivity

ESP 8266 12e: Used to wirelessly connect to the firebase with the aid of Firebase-Arduino libraries. This sends and receives data from both the Firebase and main MCU.

| Specifications | |
|-------------------|-----------------------------|
| Wireless Standard | IEEE 802.11 b/g/n |
| Frequency Range | 2.412 - 2.484 GHz |
| IO Capabilities | UART, I2C, PWM, GPIO, 1 ADC |
| Cost | \$5.89 |
| Operating Voltage | 3.3 V |

ATMega328P

| Specifications | |
|--------------------|---------------|
| Pin Count | 28 |
| Flash Memory | 32 KB |
| CPU Type | 8-bit AVR |
| Number of I/O Pins | 23 |
| Cost w/ Bootloader | \$4.66 |
| Operating Voltage | 1.8 V – 5.5 V |

System Display

1602A LCD Display Module: Provides a user interface without the need for an android smartphone. Provides user instructions for interfacing with the system.

| Specifications | |
|-------------------|------------------------|
| Operating Voltage | 5 V |
| Display Format | 16 Character x 2 Lines |
| Cost | \$5.99 |

Keypad

Membrane 4x4 Matrix Keypad allows users to interact with the kiosk's user interface.

| Specifications | |
|----------------|----------------------------|
| Maximum Rating | 24 VDC, 30mA |
| Interface | 8 pin access to 4x4 matrix |
| Cost | \$ 3.40 |

Real-time Clock Module

The **DS3231** is used to keep accurate time in the system. It continues to keep time even when disconnected from its main source of power.

| Specifications | |
|-------------------|-------------------------------|
| Operating Voltage | 3.3 V |
| Accuracy | ± 2 ppm from 0°C to +40°C |
| Cost | \$6.99 |

Testing

The UNO R3 Development board is used for prototyping and testing.

| Specifications | |
|-------------------|------------|
| Microcontroller | ATMega328p |
| Operating Voltage | 5 V |
| Flash Memory | 32 KB |
| Cost | \$16.99 |

Charge Controller

- PWM - 12V
 - Arduino Nano (ATmega328P)
 - 20x4 LCD Module Shield
 - ACS712 Current Sensor
 - LM35 Temperature sensor
 - LM2596 Step Down Buck Converter
 - From 3.0-40V to 1.5-35V (DC)
- Renogy 50W 12V Monocrystalline panel
- 12V 35AH Sealed Lead Acid Battery

Charge controller MPPT vs PWM

| PWM | MPPT |
|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Switches that connects solar array to a battery. | More Complex (Expensive). |
| Automatically adjust its charging to older batteries. | Harvest more power from solar array. |
| Helps avoids with gassing and heating to battery (Float stage). | Better suited for colder conditions. |
| Good low cost solution. | ~150-200W or higher to take advantage of MPPT benefits (Operate above battery voltage; “boost” in cold climate when the battery is low). |
| Allow rapid recharge. | |
| Typically recommended for use in smaller systems where MPPT benefits are minimal (Hot Climate). | |

Charge Controller Sensor

If 5V = ADC count 1024

- Voltage Sensors utilize Voltage divider
 - $V_{in} = V_{out} * [(R1+R2)/R2]$
 - $V_{in} = \text{ADC count} * 0.00488 * [(R1+R2)/R2]$
- Temperature Sensor: if 10mV/C
 - $\text{Temp C} = (5/1024) * \text{ADC count} * 100$
- Current sensor

Note: Assuming arduino nano Vcc = 5V reference. Otherwise ADC count must be calibrated on ADC pins.

Sensor

Charge Controller Display/LED

- 20x4 LCD Display
 - Solar Wattage
 - Battery Wattage
 - Temperature
 - State of charge
 - Charging
 - Not Char
 - Current
 - Load Energy and Power
 - $P=V*I$; $E = P*t$

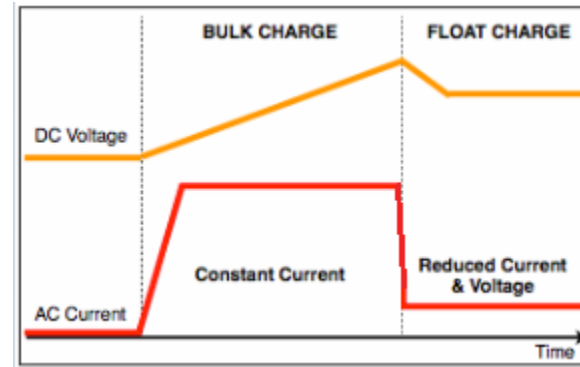

- LED Indicator
 - Battery Status
 - Red -> Voltage is low
 - $B_{\text{volt}} < 12V$
 - Green -> Voltage is Good
 - $12V < B_{\text{volt}} < 14.4V$
 - Blue -> Fully Charged
 - $B_{\text{volt}} \Rightarrow 14.4V$
 - Load Status
 - Green -> On
 - $S_{\text{volt}} < 5V$
 - $B_{\text{volt}} > 11.5V$
 - Red -> Off

Charge Controller Charging Algorithm

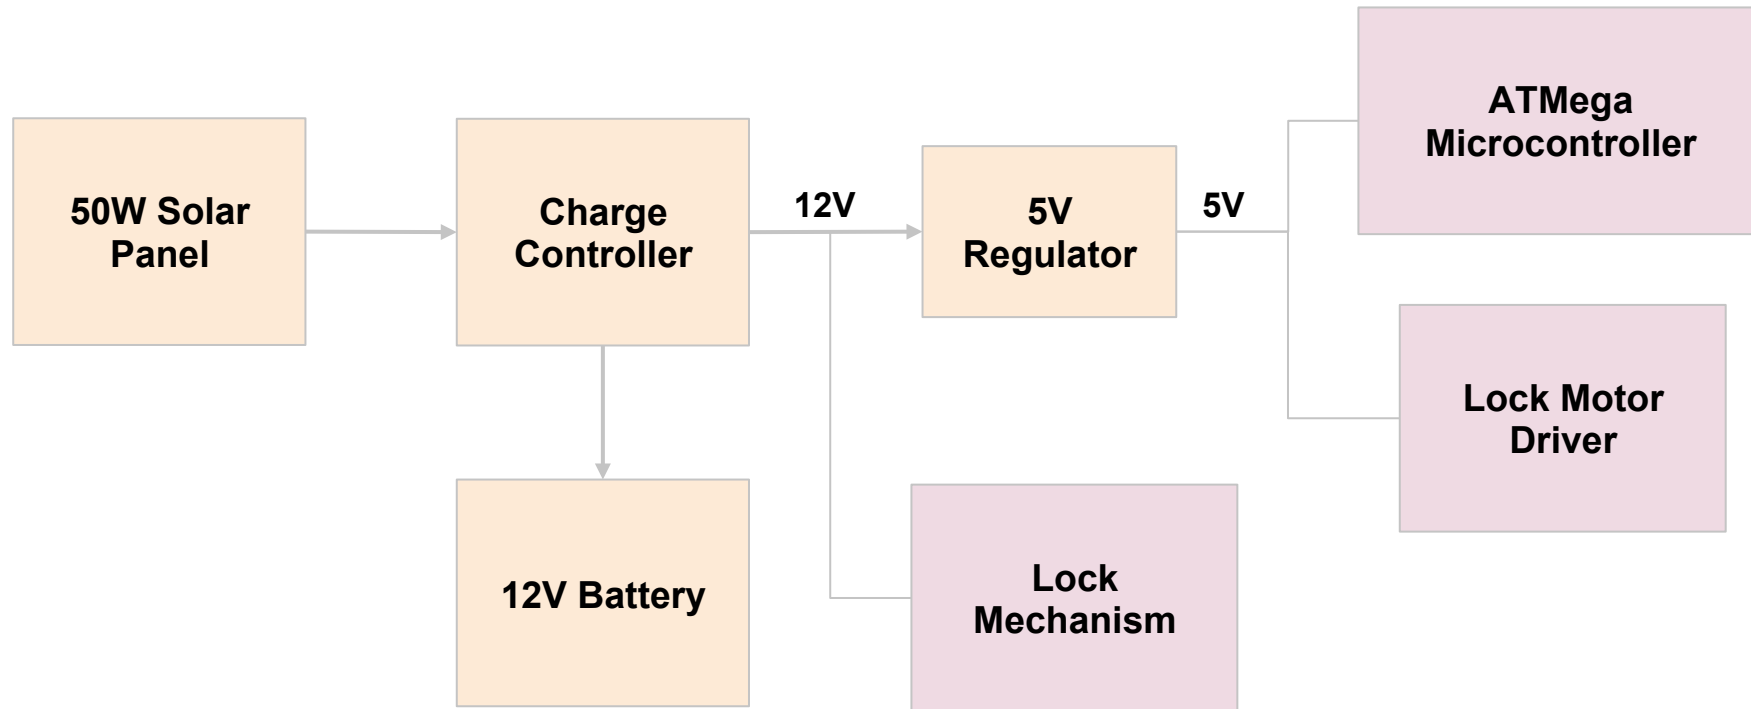

2-Stage Battery Method

1. Bulk Stage - maximum charge to preset battery voltage value. (BULK_CH_SP = 14.4)
2. Float Stage - battery voltage is reduced after charge is complete. This is to prevent gassing of the battery. (FL_CH_SP = 13.6V)

Power System

- Off-Grid Solar Powered
 - Energy Independence = competitive

Solar Power

| 12V Monocrystalline Solar Panel | |
|---------------------------------|---------|
| Manufacturer | Renogy |
| Max Power | 50W |
| Operating Voltage | 18.5 V |
| Operating Current | 2.70 A |
| Weight | 9.9lbs |
| Cost | \$88.00 |

| 12V Sealed Lead Acid Battery | |
|------------------------------|-----------------------|
| Manufacturer | Universal Power Group |
| Operating Voltage | 13.6-14.9 V |
| Initial Current | 5.25A |
| Amperage | 33 Ah |
| Cost | \$64.99 |

Locking Mechanism

| | | |
|------------------|-------------------------|---------------|
| Manufacturer | Progressive Automations | InstallGear |
| Part Number | PA-14-6-35 | IGDLA-2 |
| Voltage | 12 VDC | 12 VDC |
| Stroke distance | 6" | 1" |
| Retracted Length | 10.13" | 5.31" |
| Current (max) | 5A | 2.6A |
| Water Resistant | Yes | Yes |
| Price | \$111.99 | \$9.99 |

Motor driver

- L293D IC - dual H-bridge
 - Drive up to two DC motors simultaneously
 - Features clockwise and anticlockwise

Locking Mechanism Design

| Lock Operation | | |
|----------------|---------------|-----------------|
| | Locked (Pull) | Unlocked (Push) |
| Input 1 | + | - |
| Input 2 | - | + |

Issues

Budget

More funding for more secure components

Wifi Module Connectivity

Replaced ESP-01 with ESP-12E

Charge Controller Design

PWM Vs. MPPT

Work Distribution

| Name | Software: Mobile App | Embedded Systems | Power System | Housing/ Lock Mechanism |
