Divide and Conquer, Version 2

Farming Assistance & Solar Tracking (F.A.S.T.)

Group A

Christopher Badolato
 Nicole Andrade

 Jan G. Iglesias Morales
 Computer Engineering
 Electrical Engineering
 Computer Engineering

Motivation:

Weather accounts for 85% of crop loss for farmers. If farmers could more accurately predict the weather it would lead to a reduction in crop loss, in turn could yield greater profits, and in certain areas could provide food to those in need.

Project goals:

The F.A.S.T device will assist farmers with measuring air and soil temperature, soil humidity, and ultraviolet light, in a solar powered, remote connected weather station. The F.A.S.T device is lightweight, portable, and easy to use. The device sends data directly to an android app where the owner of the device can see the device's measurements. Using a rotating solar panel, it will track the sun and rotate accordingly. The device can assist in crop growth and livestock well being. Optimum temperature is required at the time of sowing and all life stages of crops. Excess or deficiency of moisture can lead to defective germination, growth, and maturation. High UV light can damage the DNA of some organisms. Certain UV intensity can also help plants grow. Table 3: Milestone Senior Design I and Table 4: Milestone Senior Design II outline the projected dates that this device will be produced.

Project objectives:

The objectives for this project are defined in **Figure 8:** The **House of Quality**. From this figure it is easy to see that price along with weight will provide the most limitations in terms of performance. The estimated budget has been outlined in **Table 2: Budget and Parts** to make sure that the cost objective is realistic.

Function:

The main function of the F.A.S.T device is to provide farmers with real time crop data without extensive maintenance required. Some of the devices functionality include, being able to run without a grid connected power source, the ability to connect to a mesh network, and to send accurate real time data to I/O devices. The specific requirements and specification are further referenced on **Table 1: Specification and Requirements.**

Specification and Requirements

Description	Value	Unit	
User Interface			
Product must be able to send data in real time to an Android app (C# or java) to be viewed at a specified time interval.	5	Mins	
Product must be able to alert user via app of any abnormal readings	-	-	
Application must present historical data to user	-	-	
Application must be able to poll the product and request a current reading	-	-	
Microcontroller			
I2C address width	>= 7	bits	
Low voltage	<=7	Volts	
Low power draw	-	-	
Bluetooth 5.2 with Mesh Network capability	-	-	
SPI support	-	-	
Sensors			
Lux sensor measurement range	.1-30,000	lux	
Air humidity measurement range	10%-90%	rH	
Relative Soil humidity measurement range	10%-90%	rH	
Wind speed measurement range	0-50	m/s	
UV light intensity measurement range	0-12	mW/cm ²	
Temperature Sensor Hook up temp sensor (TMP006)	32 - 120	F	

Table 1: Specification and Requirements (I)

Description	Value	Unit	
Structure			
Servo motor with specified torque	21-25	kg/cm	
Be able position PV panel to the azimuth during peak sunlight hours	-	-	
Power system			
PV module with specified max production	20	Watt	
Charge Controller	120	Watt	
Battery with specified max capacity	84	Watt	
Completely self-sufficient from PV module	-	-	

Table 1: Specification and Requirements (II)

Project Constraints

- Aside from the requirements outlined in Table 2 there are also other limitations for the project.
- Each station must draw an amount of power less than or equal to the power that each station can individually generate.
- Sensors with a relatively high degree of precision must be used to ensure that data is usable.
- Weather stations must be positioned such that they can communicate between each other through Bluetooth.
- Station must be able to endure typical outdoor weather conditions, including, but not limited to, rain, direct sunlight, cold weather, hot weather, wind, light hail.

Block Diagrams

Shown in **Figure 1** is the overall block diagram. The overall system consists of five subsystems logging, sensor, mechanical, communication, and power sub systems.

Overall Design - System View

Member Responsible : All members

Definitions

Logging System - System in charge of logging all relevant data.

Sensor System - System in charge of sensing the desired quantities using a variety of sensors.

Mechanical System - System in charge of mechanically moving the solar panel.

Communication System - System in charge of communicating data to external device

Power System - System in charge of collection power, storing power, and distributing power through the overall system

Member Responsible for Specific Block

- Christopher Badolato
- ■Nicole Andrade
- Savannah Irvin
- ☐ Jan Iglesias

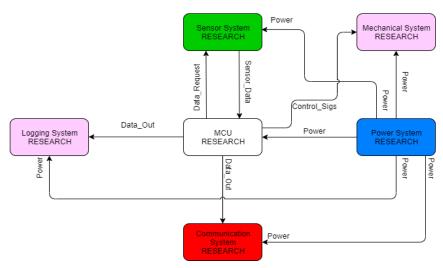

Figure 1: Overall Block Design

Shown in **Figure 2** is the sensor connection system. Each sensor has two lines, a serial data line (SDA) which sends data to or from the main processor and a serial clock (SCL) which ensures each sensor is synchronized with the master clock. Uart will be used to ensure the data from each sensor is reading correctly.

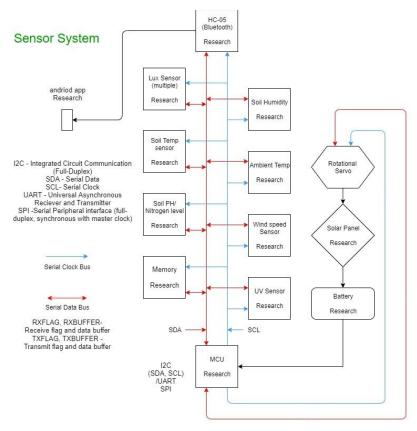

Figure 2: Sensor System Block Design

Shown in **Figure 3** is the logging system that will be implemented for this project. The logging system will be used to save measurements made by the sensor subsystem in local non-volatile memory.

Logging System

Member Responsible : Jan Iglesias

Definitions

Coin Cell Battery - A simple coin cell battery that will provide permanent power to RTC module.

RTC Module - A Real Time Clock module that will be used to allow data to be logged with a time stamp.

NVM - Non-Volatile Memory will be used to allow for permanent storage on the unit even with power loss.

 $\ensuremath{\mathsf{RTC}}\xspace_{\ensuremath{\mathsf{Comm}}}$ - A command line to allow the RTC module to be configured

Time - A line to return the current time to the MCU for logging purposes

NVM_Comm - A command line to allow the NVM to be configured

 $Data_to_Log - The \ data \ that \ will \ be \ logged \ in \ the \ NVM. \ The \ data \ includes \ a \ timestamp.$

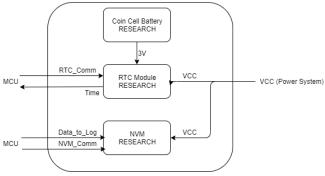

Figure 3: Logging System Block Design

Shown in **Figure 4** is the mechanical systems. This system is responsible for the structure of the weather station as well as the physical angling of the PV. The position and PV of the power will be inputs which allow the motor to change the position of the PV to azimuth.

Mechanical System

Member Responsible : Jan Iglesias

Definitions

Vertical & Horizontal Servo - A set of two servos that will be used to operate a gear system which will angle the solar panel.

Vertical & Horizontal Gear System - A set of two gear systems which will allow full rotation to be possible with the servos.

Vertical & Horizontal Angle of Panel - The angle of the panel which will be altered using the gear systems & servos to follow the sun Position (MCU) - Will set the position the servo must move to.

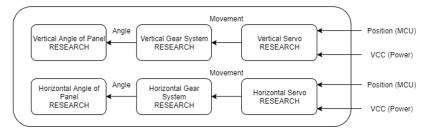

Figure 4: Mechanical System Block Design

Shown in **Figure 5** is the communication system. The communication system will consist of a display module and a Bluetooth module. The display module will receive data and commands from the MCU and will display output. The Bluetooth module will also receive data and commands from the MCU and will output data and commands.

Definitions

MCU Data - Data input from MCU such as temperature, moisture, etc. MCU Commands - Commands such as turn on, turn off and reset. Display - Data and command outputs to computer monitor. Bluetooth - Output data and output/receive commands.

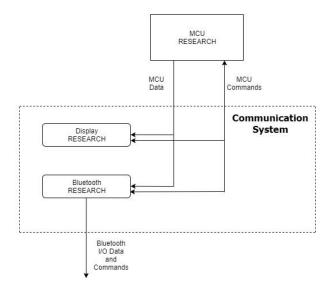

Figure 5: Communication System Block Design

Shown in **Figure 6** is the power system. The PV module will act as a current source when

adequate sunlight is applied. A charge controller is needed to check if the battery can accept current, if it can the PV will charge the battery and then the battery will go through a voltage regulator to supply power to the weather station. If the battery is full the pV will go directly to the voltage regulator and supply the weather station.

Power System

Member Responsible: Savannah Irvin

Definitions

Solar panel - 12V photovoltaic capable of producing enough watts during peak hour under suboptimal conditions to supply all power needs of weather station Charge controller- regulates the current from the solar panel going into the battery as to not damage the battery

Battery- can be recharged frequently without degrading overall quality, have enough capacity to power off peak hours

Voltage regulator- allows a constant voltage to be supplied to MCU, sensors, and communication system

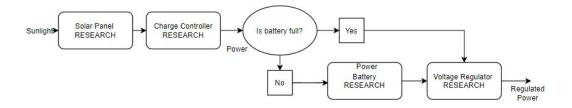

Figure 6: Power System Block Design

Shown in **Figure 7** is a software flow diagram. The MCU is in a waiting state until the data from the sensors is ready to be sent back to the MCU. Each minute the MCU will ask each sensor for the current data. If the data is legitimate the system will take appropriate action.

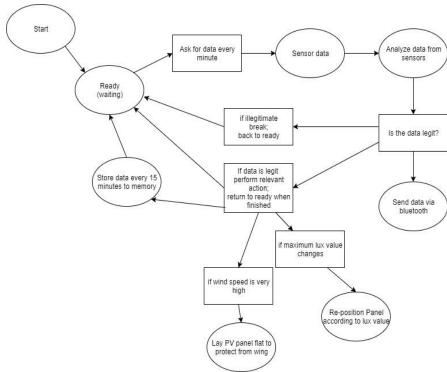

Figure 7: Software Flow Block Diagram

Estimated Project Budget

Component	Price	Status
An MCU which has I2C capabilities as well as SPI & UART.	~ \$10 / IC	Research
Solar Panel (14.4 x 13.4 x 0.9 inch) (3.45 lb) (20W, 12V)	\$30.50	Research
Rechargeable Lead Acid battery (12V 7A)	\$20.97	Research
Solar charge controller	\$11.99	Research
Adafruit lux sensor	\$5.00 * 5 = \$25	Research
<u>UV sensor</u>	\$6.50	Research
Servo for angling the panel.	\$20.00 * 2 = \$40	Research
Building materials	\$50.00	Research
Soil Sensor (moisture)	\$7.50	Research
Wind Speed Sensor	\$45.00	Research
AM2320 Digital Temp and Humidity	\$3.95	Research
HC-05 (bluetooth)	\$10.57	Research
WRL-13678 (dataSheet)	\$6.95	Research
Misc costs	\$100	Research
Tentative total:	\$368.93	

Table 2: Budget and Parts

Financing

• This project will be entirely self-funded by its team.

Spring 2020 timeline: Senior Design I

Task	Due Date
Get project approval.	January 31st
Begin code design.	January 31st
Begin first draft of project design.	January 31st
Finalize parts list.	TBD
Begin basic PCB design.	TBD
Begin embedded/firmware development.	TBD
Order essential parts.	TBD
Build breadboard prototype.	TBD
Ensure functionality of prototype and perform design revisions as necessary.	TBD
Manufacture PCB.	TBD
Assemble the first PCB based prototype and test.	TBD
Ensure functionality of prototype and perform design revisions as necessary.	TBD

Table 3: Milestone Senior Design I

Fall 2020 timeline: Senior Design II

Task	Due Date
Make any PCB corrections or revisions.	TBD
Fix any remaining issues available.	TBD
Lock in scope of project as well as design.	TBD
Manufacture final PCB used for the project.	TBD

Table 4: Milestone Senior Design II (I)

Task	Due Date
Finalize code and code documentation.	TBD
Assemble the final project unit.	TBD
Test project unit and make any repairs or corrections as necessary.	TBD

Table 4: Milestone Senior Design II (II)
